

In order to compensate for differential non-response, the Omnibus sample is divided into weighting classes of age-group by sex and Government Office Region. The number of people belonging to each sub-group in the population is provided by ONS. The weighting ensures that the weighted sample distribution across regions and across age-sex groups matches that in the population.

Consequently, respondents belonging to sub-groups that are prone to high levels of non-response are assigned higher weights. For example, young males living in London have a lower response rate and are therefore assigned higher weights than are males living in other regions.

Grossing up the data by age and sex and by region to ONS population totals will reduce the standard errors of survey estimates if the survey variable is correlated with age, sex and region.

2.1 Using weighted data

Both the design weights and the final weights are re-scaled so that the weighted sample size equals the unweighted size (i.e. the number of responding individuals).

If a module of questions applied only to a sub-group of the population, for example eligibility was restricted by age, or the module was asked only in England, the weight for the module is calculated for that sub-group and the sample size, for the weighted data, scaled back to the un-weighted figure.

When conducting statistical significance tests, using weighted data, the un-weighted sample should be used. For tests on the total (module) population the base total shown in the tables should be used. However, if sub-groups of the total (module) population are created, for example sub-groups in terms of sex, age-group, region etc., the base shown is the weighted base for that sub-group - because the weight was generated for the whole (module) population. Therefore, when conducting statistical significance tests on these sub-groups, the un-weighted base for the sub-group should be used - this can be found by running tables, etc. without applying the weight - in conjunction with the weighted data.

2.2. Calculation of the Design Weight

The first stage of the weighting procedure involves producing a design weight that corrects for unequal probability of selection caused by interviewing only one adult per household, or restricting the eligibility of the module to certain types of respondent.

i. Unit of analysis: Household

On occasions, a module may collect information about the household rather than the individual and the appropriate unit of analysis will be the household rather than the individual. For example, the questions might be concerned with details about the accommodation which could be supplied by any adult member of the household. In this case, no design weight is required because the information is collected from every household in the responding sample.

ii. Weight A (wta) - Unit of analysis: Individual

Because only one household member is interviewed, people in households containing few adults have a greater chance of selection than those in households with more. Weight A is applied to correct for this unequal probability, and is calculated by dividing the number of adults in the sampled household by the average number of adults per household. The base is then adjusted back to the number of respondents who were interviewed. Weight A is applied to modules which use the individual adult as the unit of analysis.

iii. Weight C - Unit of analysis: Household (HRP/spouse report only)

Sometimes information about the household is required that can only be supplied reliably by the household reference person or their spouse/partner. The probability that the selected respondent will be eligible for the module will be $2/n$ or $1/n$ (where n is the number of adults in the household): if the Household Reference Person (HRP) is married/cohabiting the probability that the selected respondent will be eligible is $2/n$, if the HRP is not married/cohabiting the probability is $1/n$. The weighting factor corrects for unequal probability of selection and then adjusts the base back to that of the actual number of respondents that complete the module.

2.3 Calibrating the Omnibus Sample to ONS Population Totals

After the initial design weights have been produced, the data is calibrated to ONS population totals. The calibration factors are produced by the GREG method, implemented in GES (software written in SAS). This method is a generalisation of standard post-stratification that produces weights that adjust to more than one margin.

2.4 Derivation of the Final Weights

In the final stage of the weighting procedure, the design weight is multiplied by the calibration factor.

i. indwgt

The final individual weight (indwgt) is the product of indwgtin and the individual calibration factor. indwgtin is a rescaled design weight that is the produce of wta and the population total for adults divided by the number of respondents.

ii. hhwgt

The final household weight (hhwgt) is the product of hhwgtin and the household calibration factor. hhwgtin is a rescaled design weight. Ideally this would be the total number of households in the population divided by the number of responding households in the sample. However the total number of households in the population is not known. The ratio is estimated by dividing the total number of people in the population by the number of people in all the responding households.

The design weights and the final weights are supplied in each survey month.

2.5 Effective Sample Size

This method of sampling and the consequent weighting affect the sampling errors of the survey estimates. The effect can be shown by calculating the Effective Sample Size which gives the size of an equal probability sample which is equivalent in precision to the unequal probability sample actually used. The Effective Sample Size will vary slightly from one month to another with the proportions of interviews in different sized households. On average the Effective Sample Size of the Omnibus Survey is 84% to 86% of the actual sample of individuals, when Weight A is applied. An achieved sample of 1800 individual adults in the Omnibus Survey is equivalent to an equal probability sample of about 1500.

Where individuals are interviewed as representing their households and no weighting is needed, there is no reduction in precision. Where questions relating to the household are addressed only to the Household Reference Person (HRP) or the spouse of the HRP and Weight C is applied, the Effective Sample Size is 86% to 87% of the interviewed sample. The proportion of households in which the selected respondent is the HRP or spouse has varied between 82% and 95% so the sample size for this kind of module will be about 1500 if the total sample is 1800. The Effective Sample Size will be about 1450.

3. Sampling errors

The Omnibus is a sample survey and thus estimates are subject to sampling variability. Sampling variability is dependent on several factors, including the size of the sample, clustering and the effect of weighting on the variable of interest. Standard errors, which give an indication as to the amount that a given estimate deviates from a true population value, are supplied for all variables. The sampling errors are provided on an Excel spreadsheet.

4. Field Work

All interviews are carried out face-to-face by members of the general field force of interviewers trained to carry out National Statistics surveys. Advance letters are sent to all addresses, prior to the interview, giving a brief account of the survey. The interviewing period starts during the last two weeks of the month and continues into the first two weeks of the following month. Interviewers call at all the selected addresses unless a refusal has been made beforehand in response to the advanced letter. The interviewer makes at least three calls at an address at different times of the day and week before coding the household as a non-contact.

As with all National Statistics surveys, a quality check on field work is carried out through recall interviews with a proportion of respondents to make sure that the interviews actually took place with those respondents and that responses to questions are consistent.

5. Calculation of Response Rate

The small users' Postcode Address File includes some business addresses and other addresses, such as new and empty properties, at which no private households are living. The expected proportion of such addresses, which are classified as ineligible, is about 9-10%. They are eliminated from the set sample before response rates are calculated.

5.1 Response Rate for November 2005

The response rate is calculated as the number of achieved interviews as a percentage of the eligible sample. The response rate detailed below is for the entire Omnibus sample and may not reflect the number of cases in your data.

The response rate for November was 63% as shown below:

		%	%
Selected addresses	2014	100	
Ineligible addresses	175	9	
Eligible addresses	1839	91	
<i>Refusals</i>	<i>486</i>		<i>26</i>
<i>Non-Contacts</i>	<i>202</i>		<i>11</i>
<i>Interviews Achieved</i>	1151		63

6. Output contained in the report

6.1 Frequency counts

Frequency counts for the classificatory variables and client questions are provided, showing non-response to individual questions (item non-response).

Item non-response occurs for three reasons:

- a. the respondent was not eligible for the question and they were routed past the question.
- b. the respondent was unable to answer (did not know) the question.
- c. the respondent refused to answer the question.

6.2 Tables

Each table is based on the sample answering both the client question and the relevant classificatory question so both the base and the percentages in the total column may vary slightly from one table to another. Percentages are rounded to the nearest whole number.

Tables based on questions that allow more than one answer to be given (multiple response questions) contain all the responses given by the respondent. The percentages in the table may therefore add up to more than 100% because respondents may give more than one answer.

Some bases within tables are very small. The confidence intervals surrounding percentages calculated on bases of 30 cases or less will be very large and we would advise that such results are reported with a great deal of caution.

6.3 Classificatory variables

The module variable names are related to the program question numbers. Module variables are prefixed with M. The classification variables use names. These follow Social and Vital Statistics Division standards for surveys wherever possible.

Notes on the classificatory variables follow:

Household:

GORA Government Office Regions

- 1 North East
- 2 North West
- 3 Yorkshire and the Humber
- 4 East Midlands
- 5 West Midlands
- 6 East of England
- 7 London
- 8 South East
- 9 South West
- 10 Wales
- 11 Scotland

NUMADULT Total number of adults

NUMCHILD Total number of children

N1TO4 Children 0-4

N5TO10 Children 5-10

N11TO15 Children 11-15

NumDepCh Dependent children (aged under 16 or aged 16 to 18 and in full-time education)

DMHSIZE Total number of people in the household

HHTYPB Household Type B (Coded by interviewer)

- 1 One person only
- 2 HRP married cohabiting with dependent child
- 3 HRP married cohabiting no dependent child
- 4 HRP lone parent with dependent child
- 5 HRP lone parent no dependent child
- 6 All others

HHTYPA Household Type A (Computed)

- 1 1 Adult aged 16 to 64
- 2 1 Adult aged 65 or more
- 3 2 Adults aged 16 to 64
- 4 2 Adults, 1 aged 65 or more
- 5 3 Adults
- 6 1 or 2 child
- 7 3+ children

- HHTYPE Household Type B - grouped
- 1 One person only
 - 2 Married cohabiting with dependent child
 - 3 Married cohabiting no dependent child
 - 4 Lone with dependent child
 - 5 All others

(Code 5 at HHType B, where the HRP is a lone parent with no dependent children, and Code 6 at HHType B, All others, are combined into category 5, All others at HHType.)

- TENGRP Grouped Tenure
- 1 Owns outright
 - 2 Owns mortgage
 - 3 Rents Local Authority/Housing Association
 - 4 Rents privately
 - 5 Squatting

- TEN1 Tenure (questionnaire variable)
- 1 Own it outright
 - 2 Buying it with the help of a mortgage or loan
 - 3 Pay part rent and part mortgage (shared ownership)
 - 4 Rent it
 - 5 Live here rent free (including rent free in relative's/friend's property: excluding squatting)
 - 6 Squatting

- TIED Does the accommodation go with the job of anyone in the household?
- 1 Yes
 - 2 No

- LLORD Who is your landlord?
- 1 the local authority/council/New Town Development/Scottish Homes
 - 2 a housing association or co-operative or charitable trust
 - 3 employer (organisation) of a household member
 - 4 another organisation
 - 5 relative/friend (before you lived here) of a household member
 - 6 employer (individual) of a household member
 - 7 another individual private landlord

- FURN Is the accommodation provided:
- 1 furnished
 - 2 partly furnished
 - 3 unfurnished

- CARS Car or van available to household?
- 1 Yes
 - 2 No

NUMCAR How many cars and or vans are available to the household?

CAR Car or van available to the household

- 1 None
- 2 One
- 3 Two
- 4 Three or more

PAIDJOB Number of members of the household who have a paid job?

Individual - demographic

National Statistics Omnibus Survey

(OVσ)

MODULE INSTRUCTIONS

November 2005

Cycle 05/11

Module	Title	Addressed to whom	Estimated Average duration
M130	Smoking and Tobacco consumption	All	10 mins (Smokers) / 3 mins (Non smokers)

Time allowances (based on a full quota of 30 addresses)

The Omnibus Survey runs to a tight timetable. The individual times given above for individual modules are intended as a rough guide. You should run through the questionnaire using training cases before starting fieldwork, and this may give you a clearer idea of the overall average length of interviews. Remember to also make allowance for introductions and conclusions after interview.

If you experience difficulties with the times allowed, contact the Field Office without delay.

*You should claim the actual time spent **up to** these maxima.*

- 8 days (48 hours) England, Scotland and Wales within sampled area – excludes travel time to area.
- Up to 3 hours to read 2005-6 Annual Instructions. (*Only may be claimed once on your first Omnibus quota in the survey year April to March.*)
- Up to 1½ hours to read these monthly instructions and work through training cases.
- Up to 2 hours to prepare for your quota.

- Name** Please enter the adult household members in order of date of birth starting with the eldest.
- MarStat** If person is married but not separated and yet living apart from their partner for some reason e.g. work, then you would still record them as married and living with their wife/husband.
- Hhldr** This question is standard across all household surveys. It is in place in order to aid the calculation of the HRP. It refers to **household members only**. The accommodation can only be owned or rented (3) *'jointly'* with another household member. If the accommodation is owned or rented jointly with a person outside of the household and with no other household member you will code '1. *This person only*' rather than '3. *This person jointly.*'
- Depchd** This question asks those aged 16 to 18, who are single, whether they are still at school or in full-time education, and are therefore considered **dependent children**. At HHTYPB, the computer will check that there are dependent children listed in the household box if codes 1 or 3 are entered.

For definition of dependent child aged 16-18 see Annual Instructions section 7.4.

**HRP,
HHTYPEB,
and
TENURE**

Although these questions refer to the circumstances of the Household Reference Person (HRP) you should get the information from the **selected person**. (Of course, in many instances the respondent is the HRP.)

For definition of HRP see Annual Instructions section 7.3.

Totus1

This question asks about the usual hours of paid work a respondent does. This covers full and part-time work. Record hours from zero to 96. If they work more than 97 hours or more use code 97.

Hours of work should be recorded to the nearest 15 minutes, e.g. 36 hrs 30 mins would be recorded as 36.5.

Meal breaks should always be *excluded* from the total, regardless of whether they are paid.

Guidance

Unusual work patterns

If the work pattern is not based on a week, get an average over the last four weeks.

Illness

If the respondent has been off sick for a long period take the usual hours worked before going sick.

New Job

If a person has started a new job in the reference week, the usual hours should relate to what the person expects them to be in the future.

Teachers

For teachers you should accept the answer given, which may very well be more than the normal 27 to 28 hours.

Trainees

For apprentices, trainees and other people in vocational training exclude any time spent in school or other special training centres outside their workplace.

Self-employed

Self-employed people often find it difficult to give precise figures. It is important, however, that we have information about their hours worked to compare these with the hours worked by employees. If necessary, encourage them to work things through on a daily basis and get as accurate a figure as possible.

Respondents working 'on-call'

If someone states at the hours questions that they usually work 24 hours a day because they are 'on-call', probe for the average number of hours *actually* worked. Identify the number of hours *actually* worked over the last four weeks and use the average of these to obtain a weekly total for usual hours. For example, where a respondent was on-call all night, but was only called out to work for two hours, the actual working hours for that night would be two hours. However if on duty (like a warden) and they have to be up and about then count all hours on shift as paid work.

Hout

For full list of Outcome Codes see Annual Instructions section 45. Please be absolutely certain of your outcome before your final transmission back to the office.

Client: Department of Health.

Target Group: All.

Opinion Questions: M130_1, M130_15eM, M130_15fM, M130_31, M130_32a - , M130_32f, M130_33a - M130_33f, M130_34a - M130_34d, M130_37a, M130_40M, M130_41M.

This module is being asked on behalf of the Department of Health. The questions relate to smoking.

Do not comment on the hazards of smoking or on your own feelings about smoking. However, if you need to explain the purpose of the section you can say that over time there has been a lot of discussion about the effect of smoking on health, and the Department of Health is interested to see what effect this is having on people's smoking habits.

We are only interested in ordinary tobacco which is smoked. You should therefore ignore any references to snuff, tobacco or tobacco products that are chewed or sucked, or herbal tobaccos.

- M130_1** (The actual answer is **smoking**. Only inform the respondent if asked and ideally at the END of the interview.)
- M130_2** Do not define 'nowadays', but ask respondents to decide instead.
- M130_3 & M130_4** Note that daily figures are required at both of these questions.
- M130_5** If respondents say that they smoke both packeted and hand-rolled cigarettes please probe to clarify whether they *mainly* smoke one sort more than the other.
- M130_10** If it varies ask for what their usual pattern is.
- M130_15c & INT15** You can only enter 0 (stopped for less than one week) at INT15 if you entered 'Weeks' at M130_15c.
- M130_14 & M130_21a** M130_14 is about intention to quit smoking, and M130_21a is about expectations about being a smoker in a year's time. There is a suppressible check for inconsistencies in responding to these two questions.
- M130_22a - M130_22e** This set of questions asks about advice people have received on smoking. M130_22e asks about advice given by a consultant or hospital doctor. This question comes in-between M130_22c and M130_22d.
- M130_25M & Spec25M** Uses SHOWCARD X25.
This question is about the use of Nicotine Replacement Therapy (NRT), such as gums, patches, inhalators and other drugs to help people stop smoking. There are various ways respondents can get hold of NRT and the Department of Health want to know
- whether or not the respondent was prescribed NRT; and

- whether or not the respondent paid for NRT.

The Department are also interested in whether the respondent has been **prescribed** any other drugs to help them stop smoking.

Please code all answers that apply

There are suppressible checks for inconsistencies between responses to M130_25M (use of NRT etc) and responses to questions about advice on smoking that appear between M130_22a and M130_25g.

- M130_32a** - For information - If a child lives with someone who smokes, or if you breathe in someone else's smoke the risk of developing diabetes is **not increased - the risk of developing all the other health problems are increased.**
- M130_34a** - This set of questions asks about how much a respondent agrees or disagrees there should be smoking restrictions in certain public places.
M130_34f
- M130_35a** This question asks about attitudes to smoking in front of children. It aims to understand if respondents are aware of the risk of second-hand smoke to children. The question is asked after M130_34d and before M130_35.
- M130_35** This question asks about the smoking restrictions there are at the respondent's workplace. This question is only asked of respondents who are currently working.
- M130_42** This question asks about the respondents' personal preferences towards smoking in pubs. Please note this question is asking about what the respondent would **prefer**. The question is asked after M130_35 and before M130_36.
- M130_43** This question asks how often the respondent would visit pubs if the restrictions stated at M130_42 were in place.
